

Problem 1

The constructed neural net follows the diagram below. $x \in \mathbb{R}^{785}$. For clarity, shapes of the solutions are given in brackets. Subscript j denotes a row index. A_j^T indicates the transpose of A_j .

We can substitute the following expressions:

$$\begin{aligned} \nabla_{W_j} z_j &= z_j(1 - z_j)h^T & [1 \times 201] \\ \nabla_h z_j &= z_j(1 - z_j)W_j^T & [201 \times 1] \\ \nabla_{V_j} h_j &= \text{sech}^2(V_j x)x^T & [1 \times 785] \end{aligned}$$

We can also use backpropagation to show:

$$\begin{aligned} \nabla_{W_j} L &= \left(\frac{y_j}{z_j} - \frac{1-y_j}{1-z_j} \right) (z_j(1 - z_j)h^T) & [1 \times 201] \\ \nabla_h L &= \sum_{j=1}^{26} \left(\frac{y_j}{z_j} - \frac{1-y_j}{1-z_j} \right) (z_j(1 - z_j)W_j^T) & [201 \times 1] \\ \nabla_{V_j} L &= (\nabla_h L)_j \text{sech}^2(V_j x)x^T & [1 \times 785] \end{aligned}$$

To enhance calculation efficiency, we can reduce some of these equations into matrices. First, let \mathcal{Q} be the matrix

$$\mathcal{Q} = \begin{bmatrix} z_1(1 - z_1) \left(\frac{y_1}{z_1} - \frac{1-y_1}{1-z_1} \right) \\ z_2(1 - z_2) \left(\frac{y_2}{z_2} - \frac{1-y_2}{1-z_2} \right) \\ \vdots \\ z_{26}(1 - z_{26}) \left(\frac{y_{26}}{z_{26}} - \frac{1-y_{26}}{1-z_{26}} \right) \end{bmatrix}$$

With this, we can reexpress the above equations.

(1)

$$\nabla_{W_j} L = \mathcal{Q}_j h^T \quad [1 \times 201]$$

or

$$\nabla_W L = \begin{bmatrix} \mathcal{Q}_1 h^T \\ \mathcal{Q}_2 h^T \\ \vdots \\ \mathcal{Q}_{26} h^T \end{bmatrix} = Q h^T = Q \otimes h \quad [26 \times 201]$$

(2)

$$\nabla_h L = \sum_{j=1}^{26} \mathcal{Q}_j W_j^T \quad [201 \times 1]$$

or

$$\nabla_h L = [\mathcal{Q}_1 W_1^T + \mathcal{Q}_2 W_2^T + \dots + \mathcal{Q}_{26} W_{26}^T]$$

$$\nabla_h L = [W_1^T \mathcal{Q}_1 + W_2^T \mathcal{Q}_2 + \dots + W_{26}^T \mathcal{Q}_{26}]$$

$$\nabla_h L = \begin{bmatrix} W_1^T & W_2^T & \dots & W_{26}^T \end{bmatrix} \begin{bmatrix} \mathcal{Q}_1 \\ \mathcal{Q}_2 \\ \vdots \\ \mathcal{Q}_{26} \end{bmatrix} = W^T \mathcal{Q} \quad [201 \times 1]$$

(3)

Additionally, let

$$\mathcal{S} = \begin{bmatrix} \text{sech}^2(V_1 x) \\ \text{sech}^2(V_2 x) \\ \vdots \\ \text{sech}^2(V_{26} x) \end{bmatrix} = \text{sech}^2(V x)$$

Then, $\nabla_{V_j} L = (W^T \mathcal{Q})_j \text{sech}^2(V_j x) x^T \quad [1 \times 785]$

or

$$\nabla_V L = \begin{bmatrix} (W^T \mathcal{Q})_1 \text{sech}^2(V_1 x) x^T \\ (W^T \mathcal{Q})_2 \text{sech}^2(V_2 x) x^T \\ \vdots \\ (W^T \mathcal{Q})_{201} \text{sech}^2(V_{201} x) x^T \end{bmatrix} = \begin{bmatrix} (W^T \mathcal{Q})_1 \text{sech}^2(V_1 x) \\ (W^T \mathcal{Q})_2 \text{sech}^2(V_2 x) \\ \vdots \\ (W^T \mathcal{Q})_{201} \text{sech}^2(V_{201} x) \end{bmatrix} x^T$$

$$\nabla_V L = \left(\begin{bmatrix} (W^T \mathcal{Q})_1 \\ (W^T \mathcal{Q})_2 \\ \vdots \\ (W^T \mathcal{Q})_{201} \end{bmatrix} \circ \begin{bmatrix} \text{sech}^2(V_1 x) \\ \text{sech}^2(V_2 x) \\ \vdots \\ \text{sech}^2(V_{201} x) \end{bmatrix} \right) x^T = (W^T \mathcal{Q}) \circ \mathcal{S} x^T$$
